ABSTRACT

Agricultural waste is an unexploited economic value, which makes it an environmental burden. In recent years, the economic importance of some important strategic crops in Egypt has increased and the quantities of waste and secondary products have increased. Both the state and the farms, prompting many farmers to dispose of their agricultural waste in economically and environmentally unsafe ways.

Therefore, the present study aimed to study the economic effects of the recycling of agricultural waste on agricultural production, and the economic

return to reusing these wastes and recycling them for organic fertilizers and non-traditional feeds.

The problem of disposal of agricultural waste in itself is an economic problem for economic, health, social and environmental reasons. Therefore, maximizing the utilization of agricultural waste, either through its use as raw materials for many important industries, increases its economic value and opens up work areas for young graduates.

As a result of the high prices of animal and poultry feed because of the increasing demand for it, there has been increasing interest in trying to use agricultural waste in many different ways in an attempt to fill the deficit in animal feed and high prices. The same is true for fertilizer and agricultural fertilizers. And to know the role played by the state in solving such problems.
